### **Google Hottrends to trade stocks**

I just came up with a cool idea. It could be possible to utilize google [hottrends](#) to trade stocks. Taking in the data into a database, creating dynamic signatures around the data and it's contents within the news and then automatically trading stocks based on the data and then merge it with the price data that's fed in from the market. You could technically auto trade based on google hottrends data to make money based on human news interest p-waves. Wow. Sorry for going off the topic of security, but I wanted to say something about my idea. Remember, I invented it, so no 10zer's trying to take props for it.
